

HOW TO CREATE A PRINT-READY FILE:

ROLL-UP DISPLAYS

The following guidelines are to help you generate a correct print file. Should you be in doubt, please download the corresponding template from our website, consult our FAQ-section, activate the optional file check by an operator or call our service.

1 FILE FORMAT

Our systems only accept PDF files that have been generated as final 1:1 format (no password protection).

2 COLOURS

Dependent upon print material, colours can show slight differences. All files should be generated in CMYK mode (Cyan, Magenta, Yellow, Black). You can apply the Fogra 39 colour profile. Files that contain RGB or Pantone colours will be modified by a standardised colour replacement.

3 RESOLUTION

The optimum resolution is between 100 and 150dpi.

4 EXTRA INFORMATION

The minimum printable point is 0,5.

5 TEMPLATE

Please download the corresponding template from our website in order to generate a correct print file for your planned product. Then personalise it with your own graphics and save the file in PDF format to adhere to all guidelines.

WARNING! Do not place important elements inside the grey strip (20 cm) at the bottom of the template: this area will not be visible in the finished product because it will be rolled up inside the frame of the banner.
